

OPERATING MODEL · DIGITAL BANKING

From projects, back to workstreams.

An AI-native operating model that restores single-owner accountability, brings craft back into delivery, and ships once across five markets.

SG TH MY ID VN

How we organise to deliver — in three chapters.

WHERE WE STARTED

Built around workstreams and craft.

Chapters Architecture · System Analysis · Engineering
Own standards, patterns and people growth across every workstream.

Single ownership made everything else work.

01 Clear ownership

One accountable Lead TDM per workstream — never any doubt about who owns the outcome.

02 Fast resolution

Production issues had an owner; fixes never fell between teams at hand-off.

03 Consistent craft

Chapters owned architecture, solutioning and standards, so quality stayed coherent.

04 Predictable delivery

Stable teams built deep domain knowledge and a dependable cadence.

Two years ago, we reorganised around projects.

BEFORE · WORKSTREAMS

- Persistent teams per business domain
- End-to-end ownership of the outcome
- Deep, retained domain knowledge
- A standing team to maintain & regression-test
- One owner when something breaks

AFTER · PROJECTS

- Teams formed and dissolved per project
- Ownership ends when the project closes
- Knowledge scatters as teams disband
- Regression support became very difficult — no standing team to maintain & re-test features
- No single owner for live issues

Chapters stayed in place — but drifted further from day-to-day delivery.

What broke along the way.

Teams that kept dissolving made accountability and continuity the first casualties.

01 No single owner

When something failed in production, nobody clearly owned the fix.

02 Knowledge walked out

Teams dissolved at project end and hard-won context left with them.

03 Regression & maintenance gaps

With no standing team, regression and support for existing features became very difficult.

04 Cost crept up

Capacity gaps were filled by vendors, while craft and SAs drifted from delivery.

The constraint and the breakthrough arrived together.

Pressures

- Rising vendor cost and dependency
- Project fatigue and churning teams
- Slow, owner-less issue resolution
- Accountability gaps across channels

Possibility

- UDE generates screens & service layers
- Kick-start AI ways of working
- Move towards in-house development
- Build-once, configure-per-market in reach

Two AI tools power the new model.

Everywhere this deck says “AI,” it means these two working together inside every workstream.

UDE

The Delivery Factory

Generates the application itself

- Generates screens & service layers
- Frontend today, backend next
- Build once, configure per market
- Delivered as a service to every workstream

Claude Code

The Coding Agent

Does the engineering work, end-to-end

- Writes, tests and builds code
- Drafts specs, reviews and plans
- Powers agents, skills & prompts
- Used by every engineer in the squad

UDE builds the application · Claude Code does the engineering — together they are the “AI” in this operating model.

NEW MODEL WITH AI

How the new model fits together.

WORKSTREAMS — OWN DELIVERY END-TO-END

Transact & Serve

Workstream Lead · 1 SA · Tech Leads · 2 squads max each · owns upgrades

Onboarding

Workstream Lead · 1 SA · Tech Leads · 2 squads max each · owns upgrades

Wealth

Workstream Lead · 1 SA · Tech Leads · 2 squads max each · owns upgrades

Engagement

Workstream Lead · 1 SA · Tech Leads · 2 squads max each · owns upgrades

CHAPTER — SETS THE DIRECTION · CROSS-CUTTING

AI & Engineering Chapter

Owns the AI engineers, tooling & shared AI commons — and sets engineering standards & craft across every workstream.

SHARED TEAMS

Release coordinates delivery; tracks releases

L3 owns production fixes & support

NEW MODEL WITH AI

Inside a workstream.

THE SQUAD — EVERYONE BUILDS WITH AI

Squad · max 4 engineers, all AI-augmented · up to 2 squads per Tech Lead.

THE WORKSTREAM OWNS IT END-TO-END

AI CHAPTER — OWNS AI ENGINEERS & TOOLING

THE DELIVERY FLOW

The process — and who's involved at each step.

Each step is AI-accelerated, so a Tech Lead and one or two executors deliver what used to take a full squad.

The shift: chapters supply the tooling & architecture, the Tech Lead directs, and 1–2 executors build — what once needed a 4-person squad.

THE NEW ROLES

Our roles, transformed by AI.

Same people, same workstream roles — each one amplified by AI.

Workstream Lead

owns the outcome end-to-end

TODAY

Plans & tracks delivery across squads.

WITH AI

AI drafts plans, status and risk views — leads with live insight, not status-chasing.

Tech Lead

player-coach · still ships code

TODAY

Reviews, unblocks and sets direction.

WITH AI

Directs AI across the squad, ships alongside the team and reviews AI-written changes.

System Analyst

1 per stream

TODAY

Writes specs & requirement documents.

WITH AI

Turns requirements into specs, test cases and acceptance criteria with AI.

Full-Stack Engineer

web · mobile

TODAY

Builds front-end features by hand.

WITH AI

Ships full features end-to-end with AI — boilerplate, tests and UI in hours.

Backend Engineer

services · APIs

TODAY

Builds services & integrations manually.

WITH AI

Generates services, APIs and data contracts with AI; focuses on design & review.

AI Engineer

agents · tooling

TODAY

— (new capability)

WITH AI

Builds agents, skills & prompts with AI and shares them to the common AI commons.

Two axes — everyone belongs to both.

Workstreams

Own the outcome · vertical

- Workstream Lead → Tech Leads → 2 squads max each
- Squad ≤ 4 — every role builds with AI
- Permanent engineers ship full-stack
- Everyone contributes to the shared AI commons

Chapters

Own the standard · horizontal

- Chapters: AI & Engineering
- AI chapter curates the shared AI commons
- Engineering owns standards & craft
- Where people grow their craft

Everyone belongs to a **workstream** — where they deliver — and a **chapter** — how they grow.

THE CASE

Lower cost. Higher ownership.

WHAT DRIVES IT

- AI / UDE automation across frontend and backend
- Insourced delivery — less vendor dependency
- Build once, configure per market
- Clear ownership — fewer escalations and rework

DIRECTIONAL OUTCOMES

- ↓ **Delivery cost**
- ↓ **Vendor reliance**
- ↓ **Time-to-market**
- ↑ **Ownership & accountability**

Targets to be baselined per market — shown directionally for now.

THE SAVINGS WITH AI

Smaller squads — but not all of it is saving.

Squads shrink by roughly half. But a share of that is reinvested into AI tooling and the AI Chapter — so the true net saving is around a third.

Illustrative — to be baselined per workstream.

THE REALITY

50%

Looks like the saving
if you only count smaller squads

-20%

Reinvested in AI
AI Chapter, agents, tooling, evals

30%

True net saving
sustainable, with capability built

Change the structure, protect the people.

01 Recast, don't remove

Every project lead maps to a workstream or chapter lead role — titles change, people stay.

02 Reskill, don't replace

Frontend developers, including vendor staff, are trained as UDE engineers.

03 Insource gradually

Reduce vendor dependency through conversion and attrition — not cuts.

04 Two ladders, one team

Grow through delivery (workstream) or through craft (chapter).

A phased path back to workstreams.

Phases overlap and run people-first — each step is reversible-safe and keeps chapters intact.

WHERE THIS TAKES US

Back to ownership. With AI doing the heavy lifting.

1 OWNER

per workstream

1× BUILD

shipped to 5 markets

↓ COST

vendor-light, AI-led

0 SILOS

craft back in delivery
